

Business & Functional Requirements

1. Purpose

This document defines the business and functional requirements for the future SAP-supported Customer Service process.

The requirements were derived from the AS-IS process analysis, Fit-Gap Analysis, improvement opportunities and TO-BE process design.

The purpose is to translate identified business needs into clear requirements that can be discussed with business stakeholders, SAP functional teams, integration teams and developers before implementation.

2. Business Requirements

Business Requirements describe **what the business needs and why**.

ID	Related Fit-Gap	Business Requirement	Business Value	Priority
BR-01	FG-01	The customer service process shall capture sufficient customer, equipment and issue information to support effective initial diagnosis.	Reduce clarification loops and improve case quality.	High
BR-02	FG-03	Customer service cases shall use standardized case categories.	Improve consistent processing, routing and reporting.	High
BR-03	FG-04	Service cases shall be prioritized according to defined business rules.	Ensure important and time-critical cases receive appropriate attention.	Medium
BR-04	FG-05	Service cases shall be assigned to the appropriate responsible service team based on defined routing criteria.	Reduce incorrect assignments and manual reassignment.	High
BR-05	FG-06	Customer Service shall have access to relevant customer, equipment and service information required for case investigation.	Improve investigation quality and reduce information searching.	High
BR-06	FG-07	The process shall support remote diagnosis and resolution before Field Service is initiated where appropriate.	Avoid unnecessary on-site visits and improve resolution efficiency.	Medium
BR-07	FG-08	The process shall provide defined criteria for determining whether Field Service is required.	Improve consistency in Field Service escalation decisions.	High
BR-08	FG-09, FG-10	Field Service shall receive sufficient and standardized information before technician planning begins.	Reduce clarification loops and planning delays.	High
BR-09	FG-11	On-site service requirements shall support structured planning, technician assignment and scheduling.	Improve coordination of Field Service activities.	Medium

ID	Related Fit-Gap	Business Requirement	Business Value	Priority
BR-10	FG-12, FG-13	Customer Service shall have visibility of relevant Field Service status and service results.	Improve case tracking and customer communication.	High
BR-11	FG-14	Customer Service shall have sufficient current information to communicate case progress and resolution to the customer.	Improve customer communication and service transparency.	Medium
BR-12	FG-15	Service cases shall follow standardized resolution and closure criteria.	Improve process consistency and data quality.	Medium
BR-13	FG-16	The future process shall support measurement of agreed customer-service process KPIs.	Enable operational monitoring and continuous improvement.	Medium

3. Functional Requirements

Functional Requirements describe **what the system/process must do to satisfy the Business Requirements**.

ID	Related BR	Functional Requirement	Target Area	Priority
FR-01	BR-01	The solution shall support mandatory customer identification, equipment/product identification, problem description and relevant error/notification information during service-request processing.	SAP Service Cloud / Portal	High
FR-02	BR-01	The solution shall identify missing mandatory information before the case proceeds to normal processing.	SAP Service Cloud	High
FR-03	BR-02	The solution shall provide standardized case categories that can be selected or determined during case processing.	SAP Service Cloud	High
FR-04	BR-03	The solution shall support defined priority values and priority-determination rules.	SAP Service Cloud	Medium
FR-05	BR-04	The solution shall support routing of cases to the appropriate responsible team based on agreed routing criteria such as case category or service responsibility.	SAP Service Cloud	High
FR-06	BR-05	The solution shall make relevant customer, equipment and service information available to Customer Service through the agreed SAP integration/process design.	SAP Service Cloud / SAP S/4HANA	High
FR-07	BR-06	The solution shall allow Customer Service to document remote troubleshooting activities and their results.	SAP Service Cloud	Medium
FR-08	BR-07	The process shall capture whether a case can be resolved remotely or requires an on-site service activity.	SAP Service Cloud	High

ID	Related BR	Functional Requirement	Target Area	Priority
FR-09	BR-08	The solution shall provide a standardized Field Service handover containing required customer, location, equipment, issue and technical information.	SAP Service Cloud / Field Service	High
FR-10	BR-08	The process shall validate required Field Service information before the request proceeds to technician planning.	SAP Service Cloud / Field Service	High
FR-11	BR-09	The Field Service solution shall support service activity planning, technician assignment and scheduling/dispatch.	Field Service	Medium
FR-12	BR-10	Relevant Field Service status information shall be made available to the originating customer-service case.	SAP Service Cloud / Field Service Integration	High
FR-13	BR-10	The Field Service result, including relevant work performed and material information, shall be available to the customer-service process after service execution.	Field Service / SAP S/4HANA / SAP Service Cloud	High
FR-14	BR-11	Customer Service shall be able to record and track relevant customer communication associated with the service case.	SAP Service Cloud	Medium
FR-15	BR-12	The process shall prevent normal closure until defined mandatory resolution information has been completed.	SAP Service Cloud	Medium
FR-16	BR-13	The solution shall provide the data required to calculate agreed service KPIs such as case volume, reassignment rate, response time, resolution time and Field Service handover rework.	Reporting / SAP Service Landscape	Medium

4. Requirement Traceability

Requirements shall remain traceable throughout the change lifecycle.

The traceability model used in this case study is:

AS-IS Observation → Fit-Gap ID → Business Requirement → Functional Requirement → Jira Change Item → Acceptance Criteria → UAT Test Case

Example:

AS-IS: Incorrect case assignment requires manual reassignment.

FG-05: Case Routing Gap

BR-04: Service cases shall be assigned to the appropriate responsible service team based on defined routing criteria.

FR-05: The solution shall support routing of cases to the appropriate responsible team based on agreed routing criteria.

The requirement will subsequently be converted into a Jira change item with acceptance criteria and validated through UAT.

5. Requirement Validation Approach

Before implementation, requirements should be reviewed with the relevant stakeholders.

The Application Process Manager coordinates clarification between:

- Customer Service Manager
- Customer Service Agents / Key Users
- SAP Service Cloud functional team
- SAP S/4HANA functional team
- Field Service team
- Integration team
- Release / Change Management

The review should confirm:

- Business need
- Requirement scope
- Priority
- Process impact
- System impact
- Integration dependencies
- Feasibility
- Acceptance criteria
- Testing requirements

Technical implementation details should be validated with the responsible SAP functional and integration teams before final solution approval.
