

SAP Customer Service

Process Improvement

Application Process Management Case Study

Prepared by **Rashmi Srivastava**

SAP Signavio • SAP Service Cloud • SAP S/4HANA • Jira • UAT • Release Planning

1. Executive Summary

From an operational Salesforce process to a standardized SAP-supported service model

BUSINESS SCENARIO

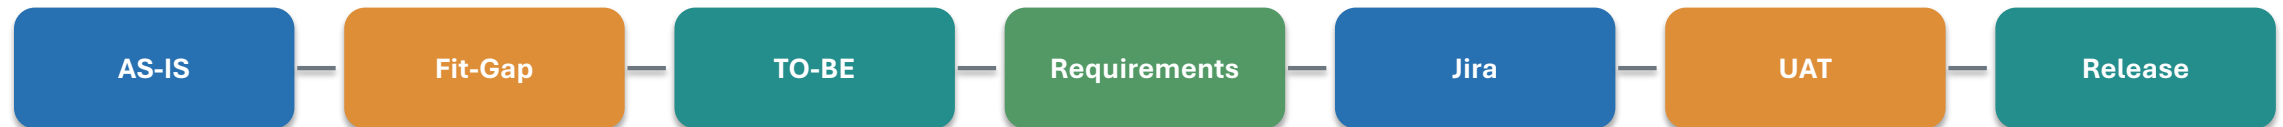

Existing customer service works, but the SAP transition creates an opportunity to standardize information, routing, handovers and visibility.

OBJECTIVE

Analyze AS-IS → identify gaps → design TO-BE → define requirements → manage representative changes → validate → prepare release.

ROLE PERSPECTIVE

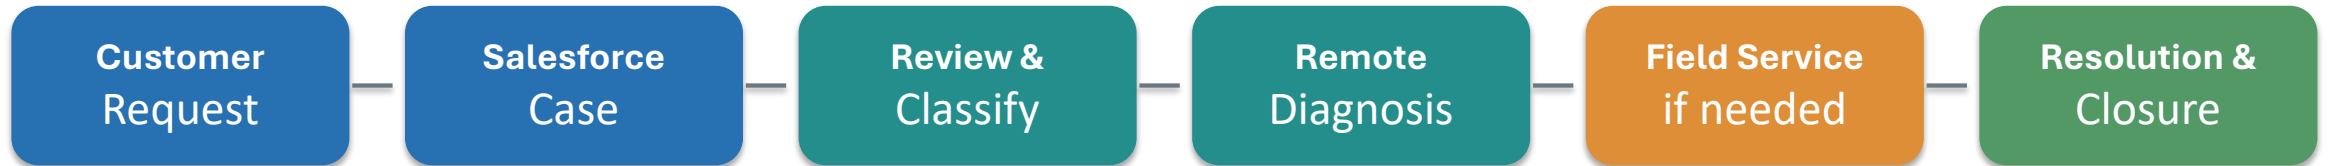

Application Process Manager bridging business process, users, SAP/application teams, testing and release coordination.

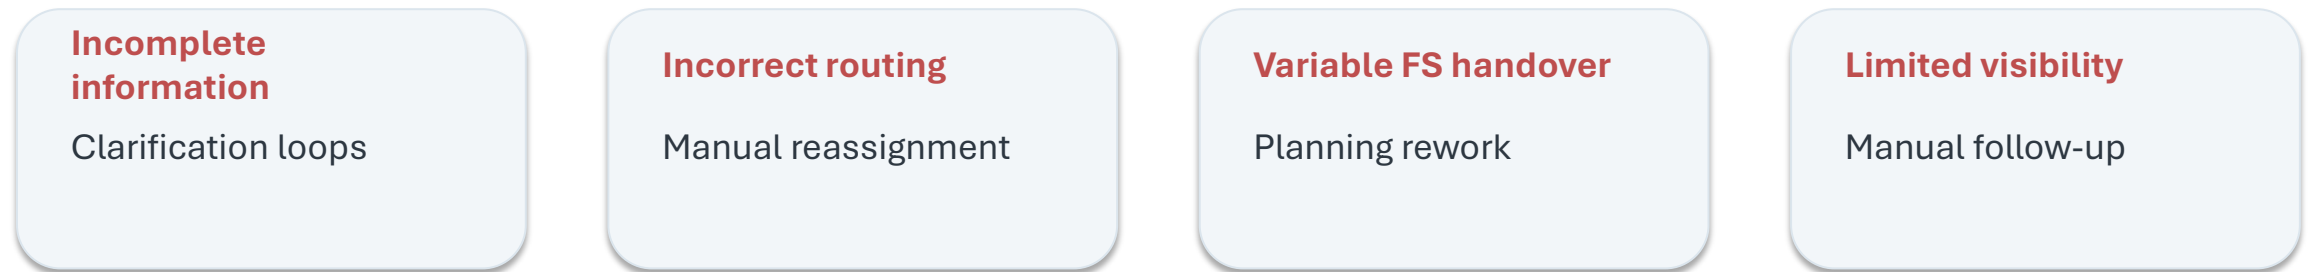

Core principle: business problem first, system second. The case study demonstrates process/application management—not productive SAP configuration.

2. AS-IS Customer Service Process

Current-state discovery and BPMN modelling

Observed improvement opportunities

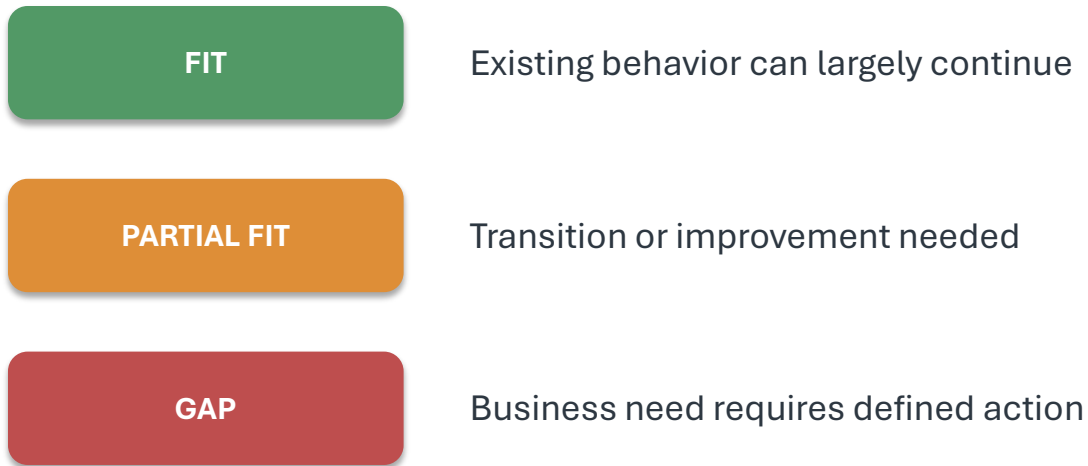

The AS-IS was treated as a working baseline—not a “broken system.” This avoids turning every Salesforce/SAP difference into an artificial gap.

Modelled in SAP Signavio using BPMN

3. Fit-Gap Analysis

Prioritizing business/process improvements

HIGH-PRIORITY EXAMPLES

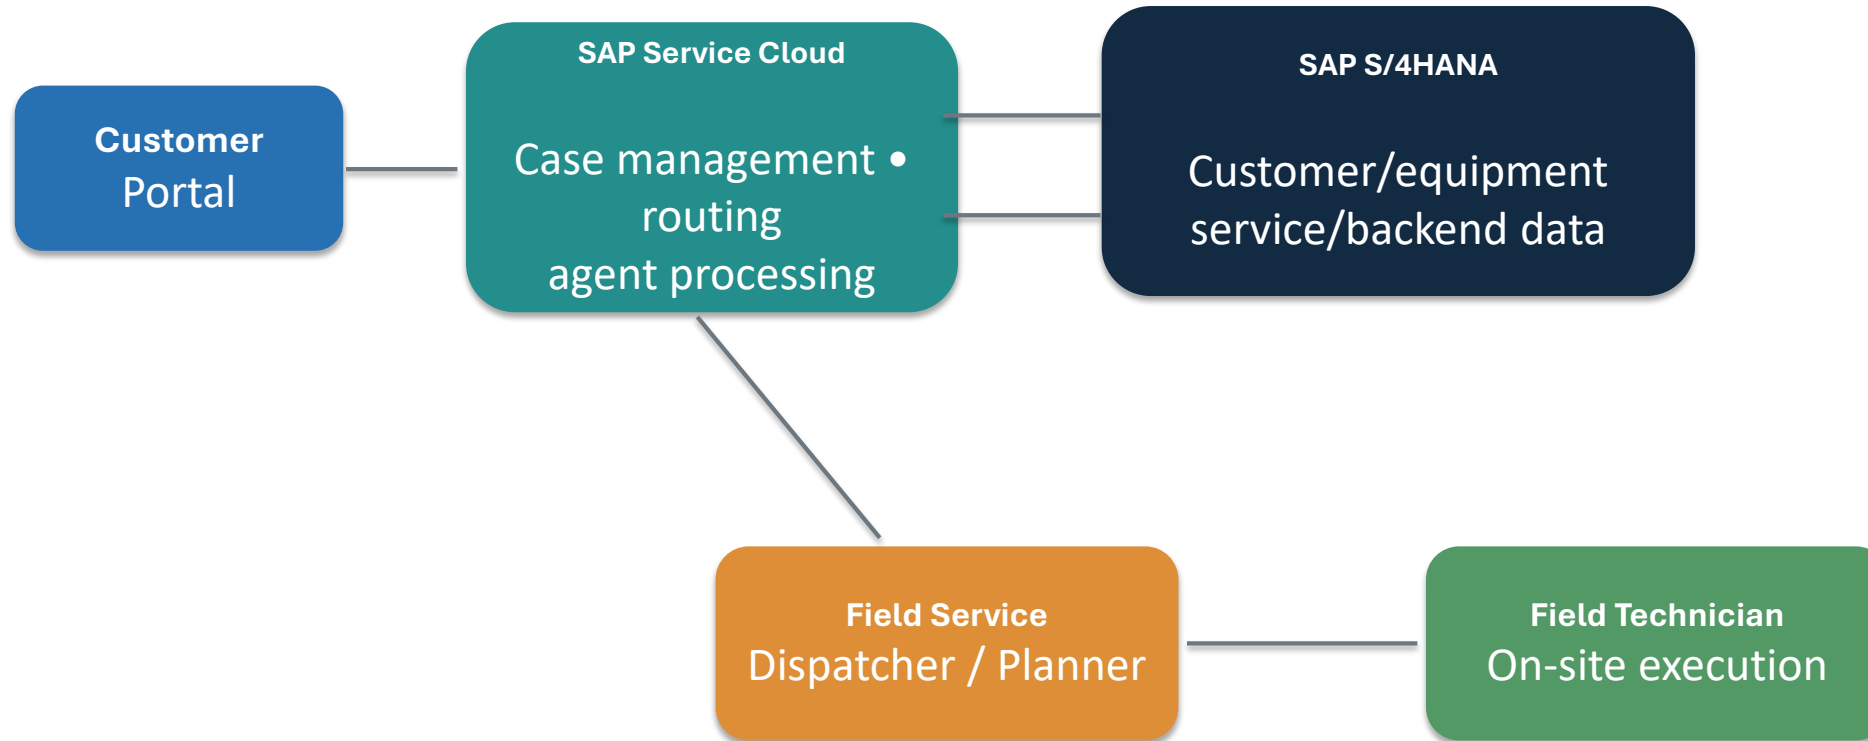

FG-01 Mandatory request information
FG-05 Rule-based case routing
FG-09 Standardized FS handover
FG-10 FS readiness validation
FG-13 End-to-end status visibility

Example improvement chain

4. Target SAP Service Landscape

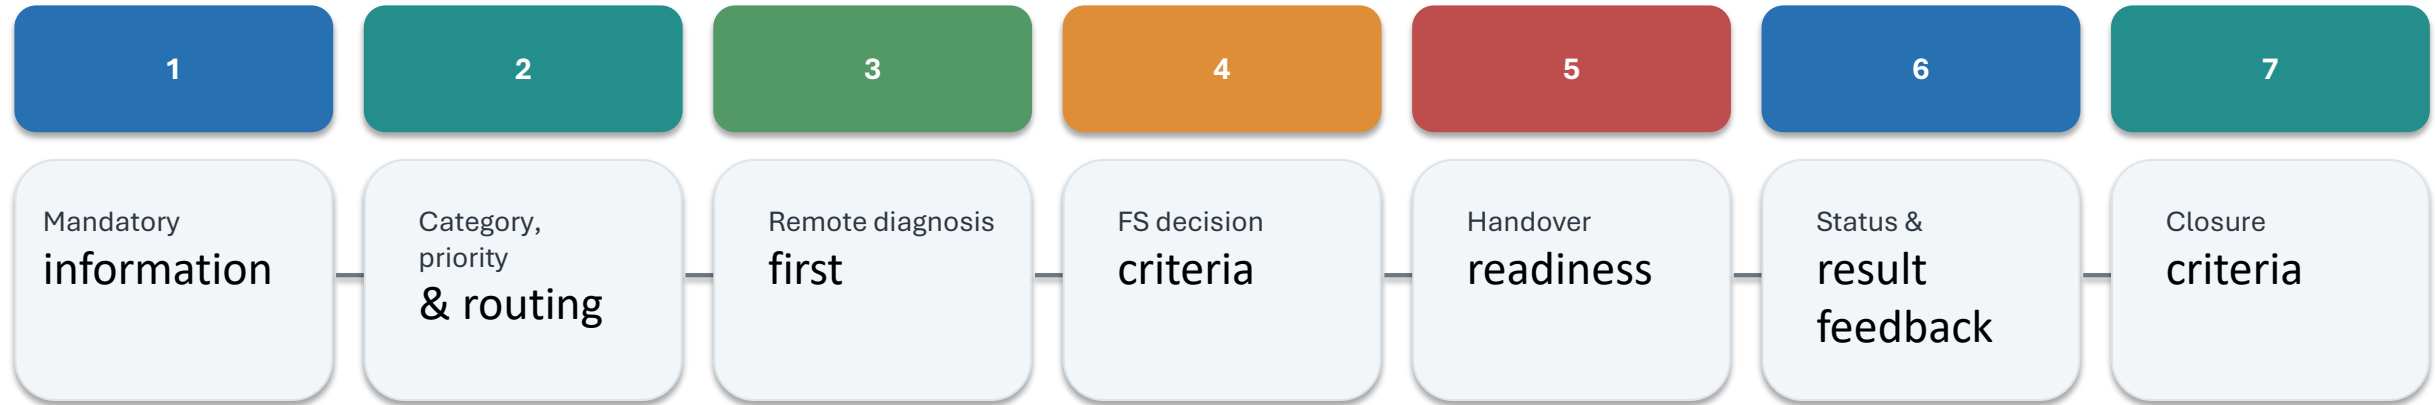

Conceptual TO-BE architecture and responsibility split

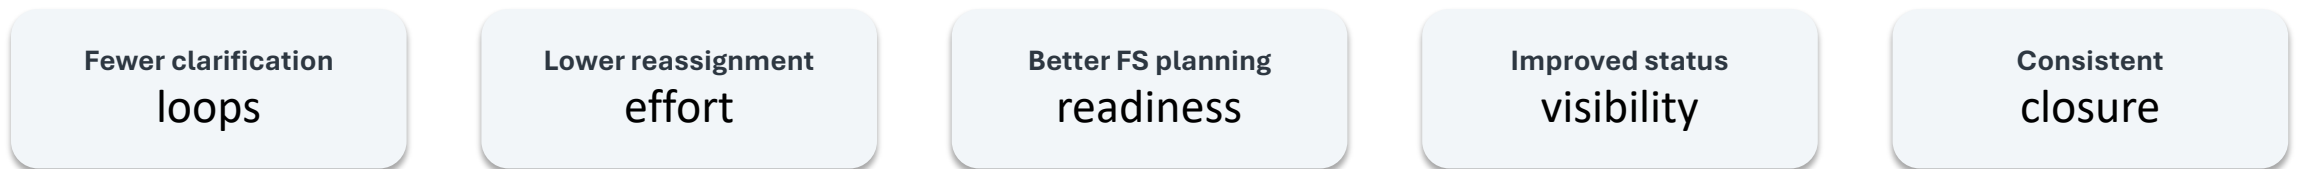

Field Service is conditional: triggered only when physical inspection, repair, replacement or another on-site activity is required.

5. TO-BE Process Improvements

Standardization before automation

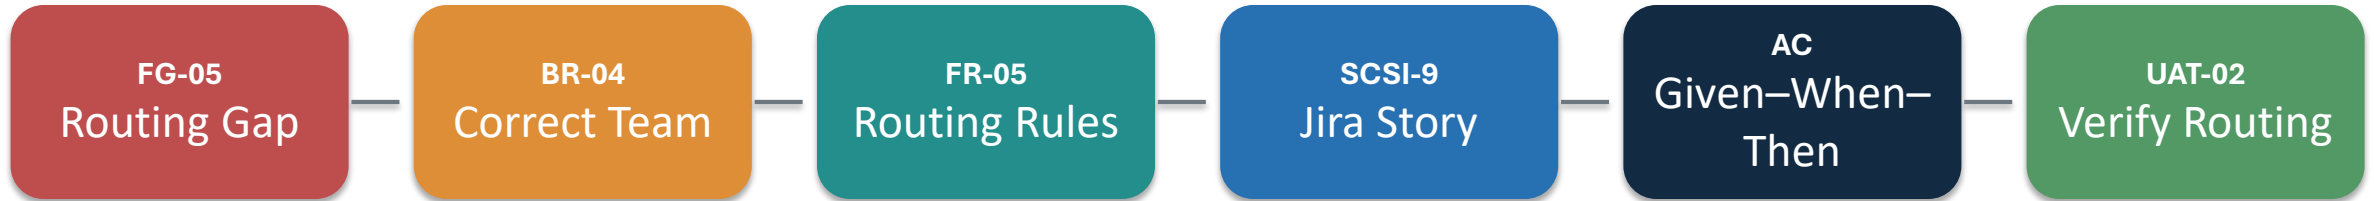

Expected process benefits

6. Requirements & Traceability

Connecting the business problem to validation

Every change remains traceable to a real process need, with clear acceptance conditions and a business validation scenario.

BUSINESS REQUIREMENT

What the business needs and why.

FUNCTIONAL REQUIREMENT

What the solution/process must do.

UAT

Business verifies implemented behavior.

7. Jira Change-Management

Representative portfolio workflow

EPIC: SAP Customer Service Process Transition & Improvement

SCSI-8	Mandatory information
SCSI-9	Case routing
SCSI-10	Remote vs FS decision
SCSI-11	FS handover/readiness
SCSI-12	FS status/results
SCSI-13	Case closure

Done

In Progress

Done

In Progress

To Do

To Do

SCSI-9 CASE ROUTING

Business context
Incorrect assignments create manual reassignment.

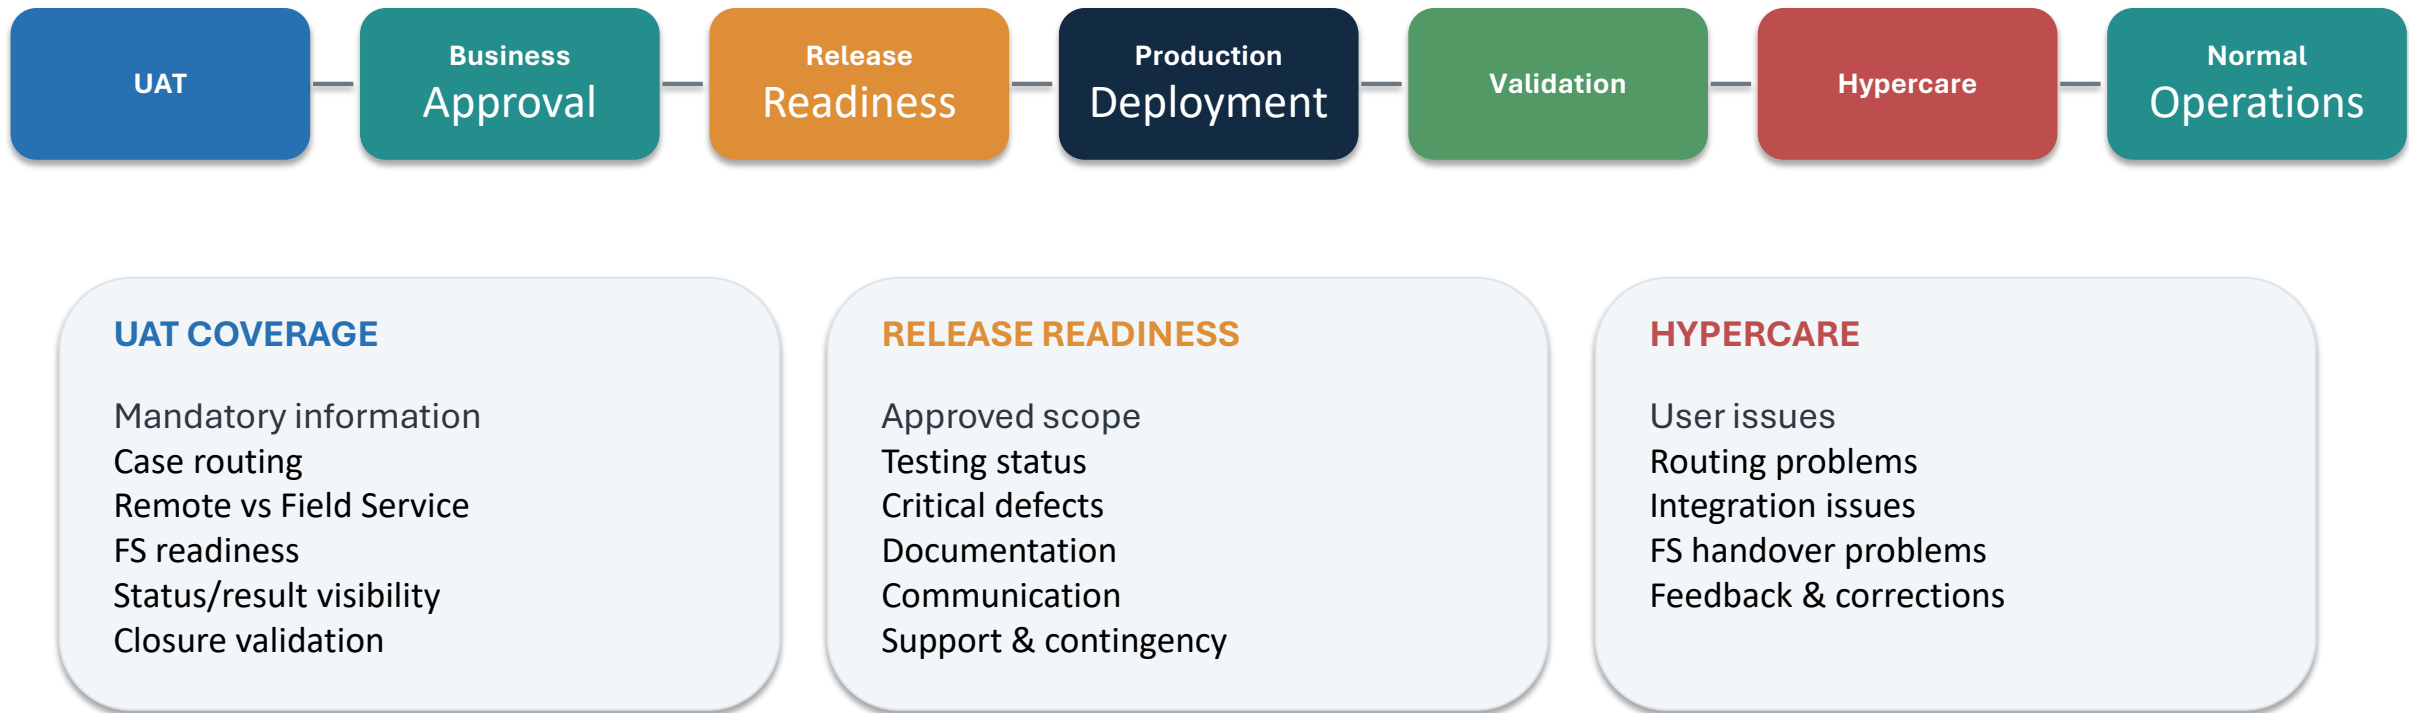

Business value
Reduce avoidable effort and delay.

Acceptance criteria
Given a defined category, when routing executes, then assign to the approved responsible team.

Workflow statuses are simulated for portfolio demonstration.

8. UAT, Release & Hypercare

From business validation to controlled adoption

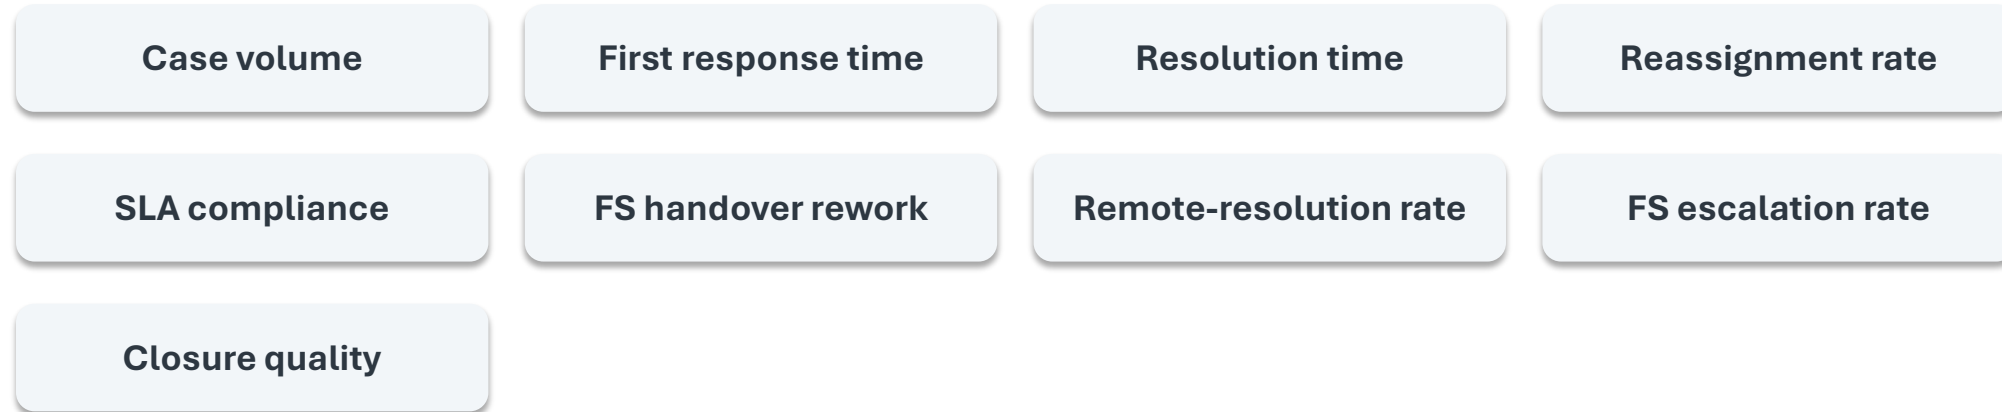

Role boundary: SAP teams deploy; the Application Process Manager coordinates business readiness, validation, communication and post-go-live process support.

9. Business Value & KPI Framework

How the future process could be monitored

Illustrative KPIs

Final KPI definitions and targets would be agreed with business and process owners.

10. Key Takeaways

A complete Application Process Management lifecycle in one portfolio case study

Positioning: self-developed portfolio case study demonstrating methodology and process/application-management capability—not productive SAP implementation experience.

AS-IS → Fit-Gap → TO-BE → Requirements → Jira → UAT → Release → Hypercare
